Risk Performance Manager (Report Builder)

Can you answer the key questions being asked by your Management Team?

Often, the discussions at management meetings generate the need for deeper investigation and analysis; ARM RPM will help Professionals quickly provide responses to these ad-hoc questions. This gives the organisation the intelligence it needs to make the right strategic decisions.

ARM RPM enables information from ARM to be presented in a variety of formats such as dashboards, tables, charts and matrices to make the information come alive. New reports can be developed quickly and easily by ARM users, without the need for IT department resources or any specialist knowledge of the underlying ARM database structure or relationships. It provides the ability to produce new management information from the information being managed in ARM. This could be risks, mitigations, incidents, investigations, controls, audits or anything that these objectives relate to - such as projects, business units, geography, assets, accounts or objectives.

ARM RPM is delivered with a range of templates. It is easy to customize the templates to create your own graphically-rich reports with drag and drop simplicity. You have complete control over data filtering, layout, presentation styles, colours, fonts, backgrounds and use of images such as company logos. RPM also gives you the freedom to do more with your data and present it in different ways such as risk scores adjusted by proximity, or to prioritise Audits according to the number of open actions.

“

“

You have complete control over data filtering, layout, presentation styles, colours, fonts, backgrounds...

ARM RPM comes with pre-defined data models that understand the relationships between all entities in the ARM database covering Risk, Incident and Audit data, as well as historical change information and relationships between Risks and Incidents or Audits.

ARM RPM combines these with the delivered report templates and your own formats to produce customized reports. ARM RPM reports inherit ARM's security and audit features to protect access to sensitive information. In this way, the same report link can be issued to different users and the security model will ensure those users can only see what is relevant to them. There is also a growing ARM RPM user community sharing useful report designs between organisations. Importantly, dashboards and reports built using RPM data models will retain forwards compatibility with future versions of ARM - thereby removing the often time consuming and expensive burden of updating custom reports as part of an ARM upgrade.

Just like standard and custom reports, the powerful data filtering model within ARM can be used to slice and dice the data that is sent to the reports using the same filters that have been created in ARM. In this way, the same report can be used to present different sets of information simply by changing the data filter.

Dashboards and reports can be published back to ARM for users through the application, which is directly accessed through a URL link from user productivity tools such as MS Outlook and MS SharePoint. It can also be accessed through any intranet, or even as desk top icons whilst still retaining the inherited security and data filtering features.

With ARM RPM, you will save days in collating multiple spreadsheets from around the organization and turning this data into reports and graphics. ARM RPM gives your management team the confidence to trust the integrity and completeness of the information presented. It gives you back the time to add value by analysing and managing the risks - rather than just administering them.
